Putting the website live

Follow these steps once the client has paid and is ready to buy the domain. The website is finished and tested; this is only about putting it on the internet. Total time: about one hour. Total cost: about ₱600 a year for the domain. Everything else is free.

BEFORE YOU START

Have these ready

- [ ] **Payment settled** with the client. Hand over logins only after this.
- [ ] **The company Gmail** (arklinefurniture3@gmail.com) and its password. Every account is made with this email, so the client owns everything.
- [ ] **The client's card** (or PayPal) to pay for the domain.
- [ ] **The owner's phone** nearby, for Google's sign-in codes.
- [ ] **Your project folder** with the `.env.local` file. It holds the keys you will copy in Step 3.
- [ ] **The latest code on GitHub:** run `git push client main` in the project folder. The repo is **arklinefurniture3-boop/arklinefurniture-main**.

STEP 1 · ABOUT 10 MIN

Create the Cloudflare account COMPANY GMAIL

1. Go to **dash.cloudflare.com** and sign up with the **company Gmail**.
2. Open the company Gmail and click the **verify your email** link from Cloudflare. **Domains can't be bought until the email is verified.**
3. Turn on **2-step verification**: profile icon (top right) → **Profile** → **Authentication**.
4. Add the client's card: **Manage Account** → **Billing** → **Payment info**.

STEP 2 · ABOUT 10 MIN

Buy the domain CLIENT'S CARD

1. In Cloudflare, go to **Domain Registration** → **Register Domains**.
2. Search **arklinefurniture.com**. If it's taken, use **arklineofficefurniture.com** or **arklinefurnitureph.com**.
3. Buy it for **1 year** and leave **auto-renew ON**, so the website never goes down because the domain expired. Privacy is free and on by default.

> **Says "unavailable" but the name is free?** The email isn't verified yet, no card is saved, or the account is too new. Fix the first two and wait an hour. If it still fails, buy at **porkbun.com** (same price) and then point it at Cloudflare.

STEP 3 · ABOUT 15 MIN

Put the site on Cloudflare Pages

1. Cloudflare → **Workers & Pages** → **Create** → **Pages** → **Connect to Git**.
2. Sign in to GitHub as **arklinefurniture3-boop**, allow access to **arklinefurniture-main**, and select it.
3. Project name: **arkline**. Framework preset: **None**. Build command: `npm run build`. Build output directory: `dist`.
4. Open **Environment variables** and add each line from the table below. Copy the values from your `.env.local`.
5. Click **Save and Deploy**. After about 1 minute the site is live at **arkline.pages.dev**. The address may differ slightly if "arkline" is taken; note the one Cloudflare shows.

VARIABLE NAME	VALUE	SECRET?
`VITE_SUPABASE_URL`	from .env.local	No
`VITE_SUPABASE_ANON_KEY`	from .env.local (starts with sb_publishable_)	No
`SUPABASE_URL`	from .env.local	No
`SUPABASE_SERVICE_ROLE_KEY`	from .env.local (starts with sb_secret_)	**Yes: click Encrypt**
`NOTIFY_EMAIL`	arklinefurniture3@gmail.com	No
`NODE_VERSION`	22	No

> **Never** paste `SUPABASE_SERVICE_ROLE_KEY` into chat, email or the code. It only goes into Cloudflare, marked as a secret.

STEP 4 · ABOUT 5 MIN

Connect the domain

1. In the Pages project, open **Custom domains → Set up a custom domain**.
2. Enter **arklinefurniture.com** and confirm. Do the same for **www.arklinefurniture.com**.
3. Wait a few minutes until both show **Active**. The padlock (HTTPS) is set up automatically and is free.

STEP 5 · ABOUT 5 MIN · DON'T SKIP

Tell Supabase the new address

Without this, Google sign-in and "Forgot password" send the admin back to localhost instead of the live site.

1. Open **supabase.com** → the Arkline project → **Authentication → URL Configuration**.
2. **Site URL:** `https://arklinefurniture.com`
3. **Redirect URLs:** add `https://arklinefurniture.com/**` and `https://arkline.pages.dev/**`. Keep the localhost one for testing.
4. Click **Save**.

STEP 6 · ABOUT 10 MIN

Turn on email alerts (Resend) COMPANY GMAIL

1. Sign up at **resend.com** with the company Gmail. Free: 3,000 emails a month.
2. **Domains** → **Add domain** → **arklinefurniture.com**. Resend shows a few records to add. Choose the option to add them to Cloudflare automatically, or copy each one into Cloudflare → the domain → **DNS** → **Records**. Wait until Resend says **Verified**.
3. **API Keys** → **Create API Key** and copy it (starts with `re_`).
4. In Cloudflare Pages → **Settings** → **Variables and Secrets**, add:
   `RESEND_API_KEY` = the key (**Encrypt** it)
   `NOTIFY_FROM` = `Arkline Website <orders@arklinefurniture.com>`

STEP 7 · ABOUT 5 MIN

Turn on the spam check (Turnstile)

1. Cloudflare → **Turnstile** → **Add widget**. Name: Arkline. Hostnames: **arklinefurniture.com** and **arkline.pages.dev**. Mode: **Managed**.
2. Copy the two keys into Pages → **Settings** → **Variables and Secrets**:
   `VITE_TURNSTILE_SITE_KEY` = the Site Key
   `TURNSTILE_SECRET_KEY` = the Secret Key (**Encrypt** it)
3. Go to **Deployments**, then open the latest one and click **Retry deployment**, so the new settings are used.

STEP 8 · ABOUT 10 MIN

Test the live site

- [ ] Open **https://arklinefurniture.com** on a phone. The padlock shows, and photos, shop and prices load.
- [ ] Send a **price request** with your own number. The success message shows a request number.
- [ ] The company Gmail receives the alert email within a minute (check Spam the first time).
- [ ] Open **https://arklinefurniture.com/admin** and sign in with **Google**. The request is there.
- [ ] Sign out, then sign in with **email and password**. Try **Forgot password**; the link must open the live site, not localhost.
- [ ] Upload one photo. It shows in the website gallery within about 30 seconds. Then move your test request and test photo to Trash.

STEP 9 · ABOUT 10 MIN

Hand over to the client

- [ ] Supabase → Organization → **Team** → **Invite** the company Gmail as **Owner**, so the client controls the database too.
- [ ] Give the owner the **Admin guide (PDF)** and the admin address: **arklinefurniture.com/admin**.
- [ ] Write down for the owner which accounts use the company Gmail: **Cloudflare, Resend, Supabase, GitHub**. Add the **domain renewal date** (one year from today) to their calendar.
- [ ] Ask the owner to **change the Gmail password** after you finish, so only they can get in.

AFTER LAUNCH

Updating the website later

1. Make the change in the project folder and check it on **localhost:5173**.
2. Commit, then run `git push client main`.
3. Cloudflare rebuilds and updates the live site by itself in about a minute.

PROBLEM	FIX
Build fails	Check `NODE_VERSION` is `22` and the build command is `npm run build`, output `dist`.
Site loads, no photos or prices	`VITE_SUPABASE_URL` / `VITE_SUPABASE_ANON_KEY` missing or misspelled. Fix, then Retry deployment.
Form says "temporarily unavailable"	`SUPABASE_URL` or `SUPABASE_SERVICE_ROLE_KEY` missing in Pages.
Google sign-in goes to localhost	Step 5 not done, or the Redirect URLs are missing `/**`.
No alert emails	Resend domain not **Verified** yet, or `RESEND_API_KEY` / `NOTIFY_FROM` missing.
"Complete the security check" every time	The Turnstile hostname list doesn't include the address you're on.
Admin shows "project paused"	Supabase pauses after 7 days with no visits. Open supabase.com → the project → **Restore**. The daily GitHub job normally prevents this.

COST

What the client pays

SERVICE	DOES	COST
Domain (Cloudflare)	arklinefurniture.com	about ₱600 a year
Cloudflare Pages	Hosting, HTTPS, spam check	Free
Supabase	Database, photos, admin sign-in	Free
Resend	Email alerts, 3,000 a month	Free
GitHub	Stores the code	Free
